McNaughton, 1993-09

A Course in Formal Languages, Automata and Groups Ian M. Chiswell, 2008-11-14 This book is

based on notes for a master's course given at Queen Mary University of London in the 1998-9 session. Such courses in London are quite short and the course consisted essentially of the material in the first three chapters together with a two-hour lecture on connections with group theory. Chapter 5 is a considerably expanded version of this. For the course the main sources were the books by Hopcroft and Ullman [20] by Cohen [4] and by Epstein et al [7]. Some use was also made of a later book by Hopcroft and Ullman [21]. The ulterior motive in the first three chapters is to give a rigorous proof that various notions of recursively enumerable language are equivalent. Three such notions are considered. These are generated by a type 0 grammar recognised by a Turing machine, deterministic or not, and defined by means of a Gödel numbering having defined recursively enumerable for sets of natural numbers. It is hoped that this has been achieved without too many arguments using complicated notation. This is a problem with the entire subject and it is important to understand the idea of the proof which is often quite simple. Two particular places that are heavy going are the proof at the end of Chapter 1 that a language recognised by a Turing machine is type 0 and the proof in Chapter 2 that a Turing machine computable function is partial recursive.

Automata and Computability Ganesh Gopalakrishnan, 2019-03-04 Automata and Computability is a class-tested textbook which provides a comprehensive and accessible introduction to the theory of automata and computation. The author uses illustrations, engaging examples, and historical remarks to make the material interesting and relevant for students. It incorporates modern handy ideas such as derivative-based parsing and a Lambda reducer showing the universality of Lambda calculus. The book also shows how to sculpt automata by making the regular language conversion pipeline available through a simple command interface. A Jupyter notebook will accompany the book to feature code, YouTube videos, and other supplements to assist instructors and students.

Features: Uses illustrations, engaging examples, and historical remarks to make the material accessible. Incorporates modern handy ideas such as derivative-based parsing and a Lambda reducer showing the universality of Lambda calculus. Shows how to sculpt automata by making the regular language conversion pipeline available through a simple command interface. Uses a mini functional programming (FP) notation consisting of lambdas, maps, filters, and set comprehension supported in Python to convey math through PL constructs that are succinct and resemble math. Provides all concepts encoded in a compact Functional Programming code that will tessellate with LaTeX markup and Jupyter widgets in a document that will accompany the books. Students can run code effortlessly. <https://github.com/ganeshutah> Jove git here
