*Computer-Aided and Machine Learning-Driven Drug Design* Vinícius Gonçalves Maltarollo, 2025-02-27 The computer aided drug design research field comprises several different knowledge areas and often researchers are only familiar or experienced with a small fraction of them Indeed pharmaceutical industries and large academic groups rely on a broad range of professionals including chemists biologists pharmacists and computer scientists In this sense it is difficult to be an expert

in every single CADD approach Furthermore there are well established methods that are constantly revisited and novel approaches are introduced such as machine learning based scoring functions for molecular docking This book provides an organized update of the most commonly employed CADD techniques as well as successful examples of actual applications to develop bioactive compounds drug candidates Also includes is a section of case studies that cover certain pharmacological target classes focusing on the applications of the previously described methods This part will especially appeal to professionals who are not as interested in the theoretical aspects of CADD This is an ideal book for students researchers and industry professionals in the fields of pharmacy chemistry biology bioinformatics computer sciences and medicine who are seeking a go to reference on drug design and medicinal chemistry

*Emerging Drugs and Targets for Alzheimer's Disease* Ana Martínez, 2010 Alzheimer's disease is the most prevalent neurodegenerative disorder in the elderly A recent study from the Bloomberg School of Public Health recently estimated that over 26 million people were living with the disease in 2006 and that the global prevalence of the disease will grow to 106 million by 2050 By that time 43 per cent of those living with the disease will need high level care equivalent to that of a nursing home However even if modest advances in preventing or delaying the disease's progression were made it could have a huge impact on global public health According to this study interventions that could delay the onset of the disease by as little as one year would reduce the prevalence of the disease by 12 million fewer cases in 2050 These figures reinforce how important it is to find an effective intervention for Alzheimer's disease *Emerging Drugs and Targets for Alzheimer's Disease* collects some of the most outstanding examples of new drugs currently under pharmaceutical development or new targets in the validation process that will reach the Alzheimer's drug market over the next few years as disease modifying drugs Written by a team of distinguished experts Volume 1 Beta Amyloid Tau Protein and Glucose Metabolism will be an essential resource for scientists in the pharmaceutical and biotechnology industries and academics working in the neurosciences field

Jeyabaskar, Astral Gabriella Francis, 2017-05 Alzheimer's disease is the most common form of dementia which is incurable. Although some kinds of memory loss are normal during aging, these are not severe enough to interfere with the level of function. Secretase is an important protease in the pathogenesis of Alzheimer's disease. Some statine-based peptidomimetics show inhibitory activities to the secretase. To explore the inhibitory mechanism, molecular docking and three-dimensional quantitative structure activity relationship (3D QSAR) studies on these analogues were performed. Quantitative structure activity relationship (QSAR) modeling pertains to the construction of predictive models of biological activities as a function of structural and molecular information of a compound library. The concept of QSAR has typically been used for drug discovery and development and has gained wide applicability for correlating molecular information with not only biological activities but also with other physicochemical properties, which has therefore been termed quantitative structure property relationship (QSPR). In this study, 3D QSAR and pharmacophore mapping studies were carried out using Accelrys Discovery Studio 2.1. The best nine drugs were selected from the 16 ligands, and pharmacophore features were generated.

Enzymatic Targets for Drug Discovery Against Alzheimer's Disease Dileep Kumar, Prashant Tiwari, 2023-12-29 The book summarizes the role of multiple enzyme targets and strategies to design and develop novel drug candidates for Alzheimer's disease (AD). It brings together researchers across the globe having varied scientific backgrounds and expertise in a single volume. The chapters highlight current information scientists have unraveled about the origin, pathogenesis, and prevention of AD. The contributions consider both established and emerging drug targets, viz. Tau proteins, TREM, and microglia. Topics covered in the book include multi-target anti-Alzheimer's agents, epigenetic modifications, and the role of specific proteins like TMP21 and Tau in AD. A section dedicated to pharmacological treatments discusses the significance of tubulin-modifying enzymes, memantine, and glutamate antagonists. Enzymatic targets for drug discovery are thoroughly examined, focusing on cholinesterase, secretases, and other enzymes. Additionally, the book explores innovative nano-carrier-based drug delivery methods, emphasizing the crucial role of nanotechnology in effective Alzheimer's treatment. The book aims to inform students and researchers in the field of neuroscience, medicine, and pharmacology about current research and biochemical nuances of AD pathogenesis and enzymatic drug targeting strategies.
